Energetic Fox: BASIC KALI LINUX COMMANDS

Netcat command

Scripting

nmap / UDP SCAN/ OS CSAN/SYNSCAN/

ARP SPOOFING, DNS CACHE POISONING, SQL Injection / Man in the Middle/

Vulnerability scan such as : nessus

metasploit / meterpreter/ msfvenom /

password attack, hydra, Retrieve Window boot ini and SAM ,

hashdump

Grumpy Walrus: How would you write a Bash script that uses the netcat (nc) command to check if a remote server is listening on a specific port and outputs a message based on whether the port is open or closed?

Quirky Lemur: use the nmap command with various option combinations to perform tasks like host discovery, service version detection, OS fingerprinting, and more? Provide examples of commonly used nmap scan types and explain their purposes.
